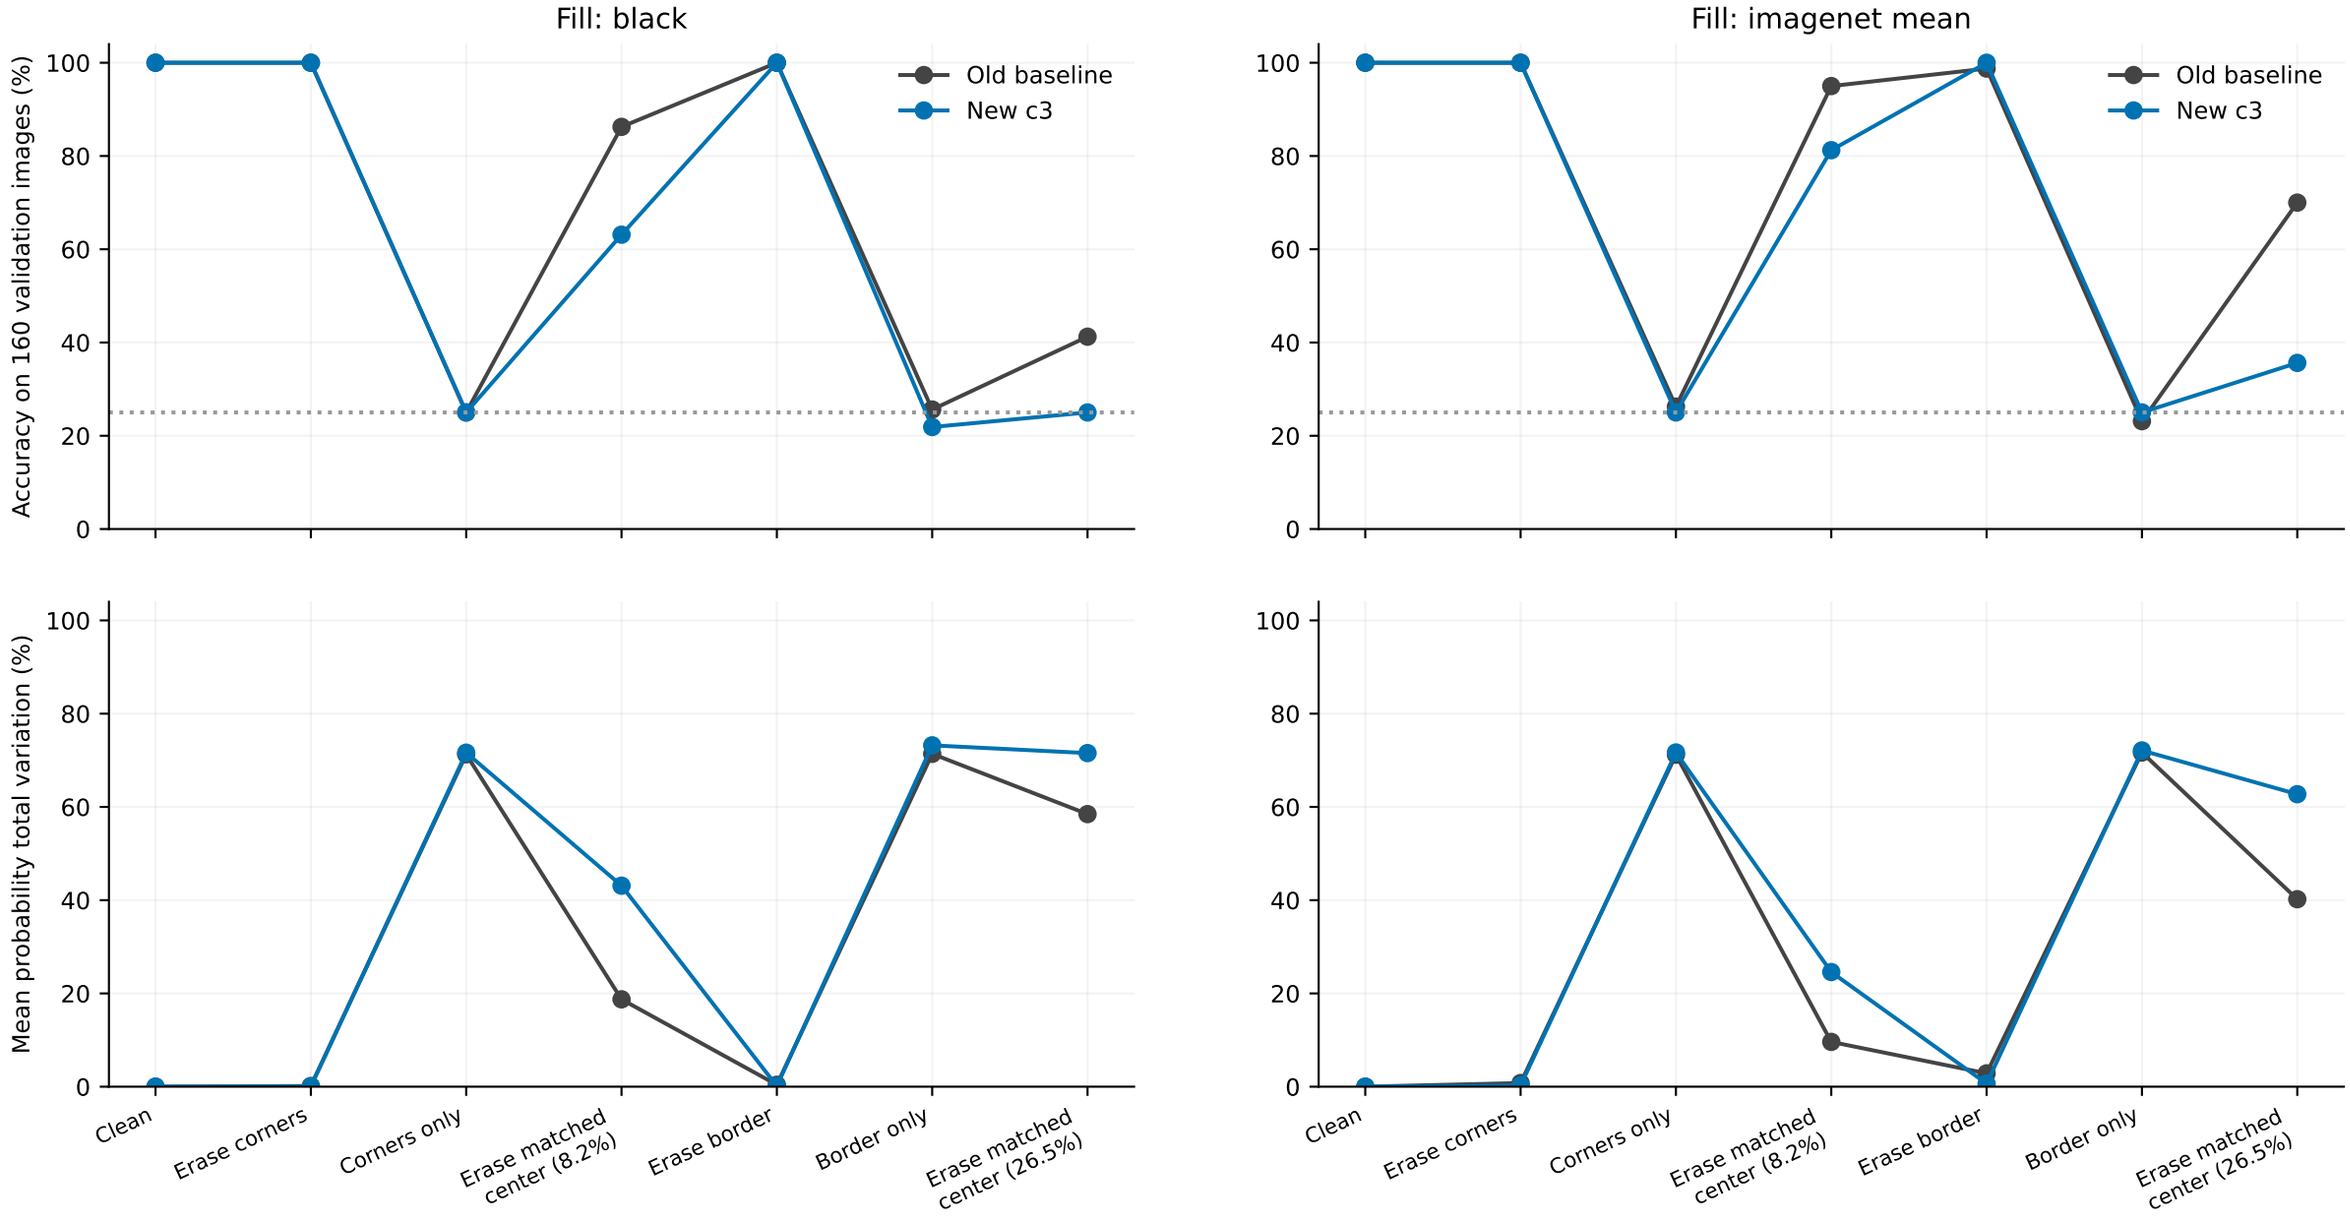
Fixed validation-only masking controls | 40 images per class



No model selection or training. Corners: four 32×32 squares; border: outer 16 pixels. Center controls mask exactly the same number of pixels.
The clean sample is balanced; 25% dotted line is a reference, not a significance test. Erasure is artificial; hash groups are not patient identities.
All images are new-model validation rows; old-baseline strict exposure was 99 training / 23 validation / 38 test images.
